

Ammonia Test Kit

The kit comes with some tubes that you fill with water and a special chemical.

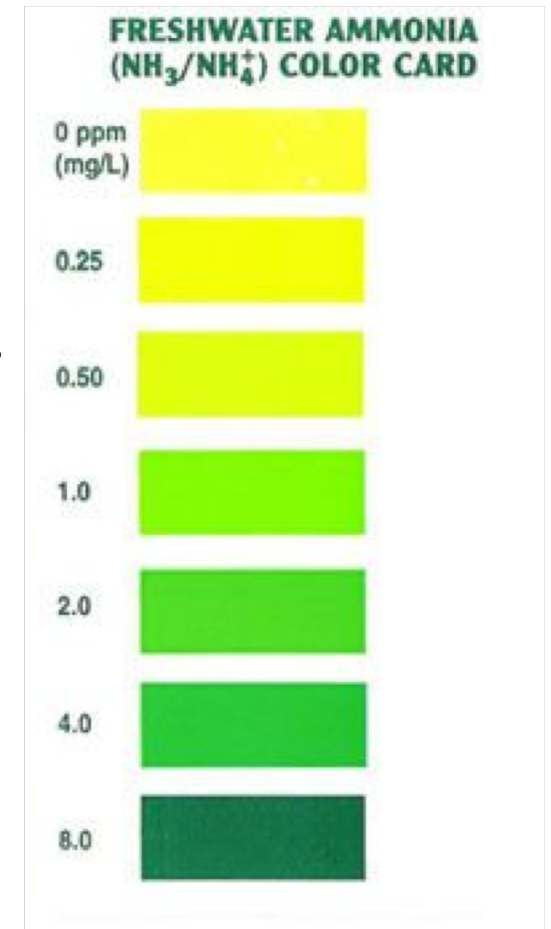

The water changes color based on the amount of ammonia,

Like this chart ->

This is what was found.

Ammonia levels closer to 0 and definitely below 2 ppm are ideal for fish health.

Comparing Ammonia in Different Fish Tanks

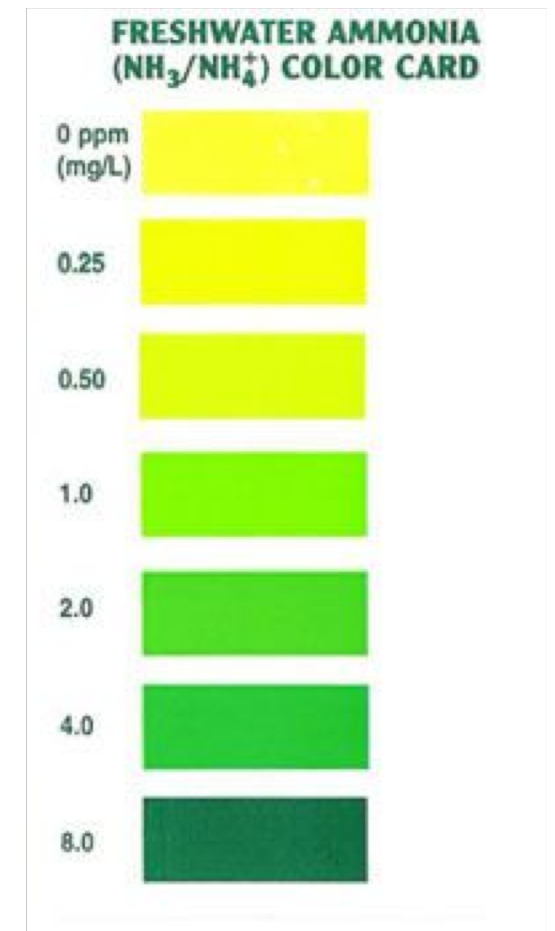

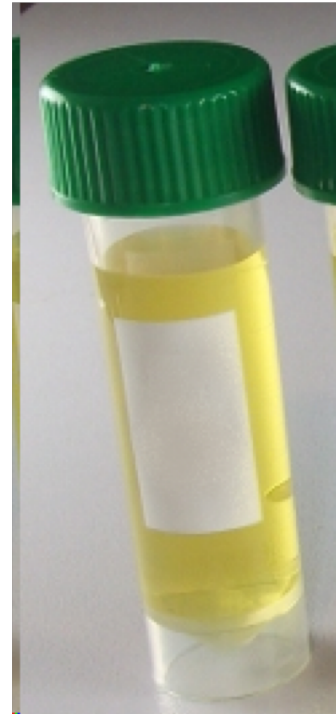

A scientist has two different aquariums. In the first tank the fish are healthy and living long healthy lives. In the second tank fish are not so healthy, many are swimming slowly and sinking to the bottom. Some of the fish are dying.

The scientist decides to compare the measure of ammonia between different tanks.

Tank 1 Results - Ammonia Test

The scientist uses an ammonia test kit to measure the ammonia in the first tank.

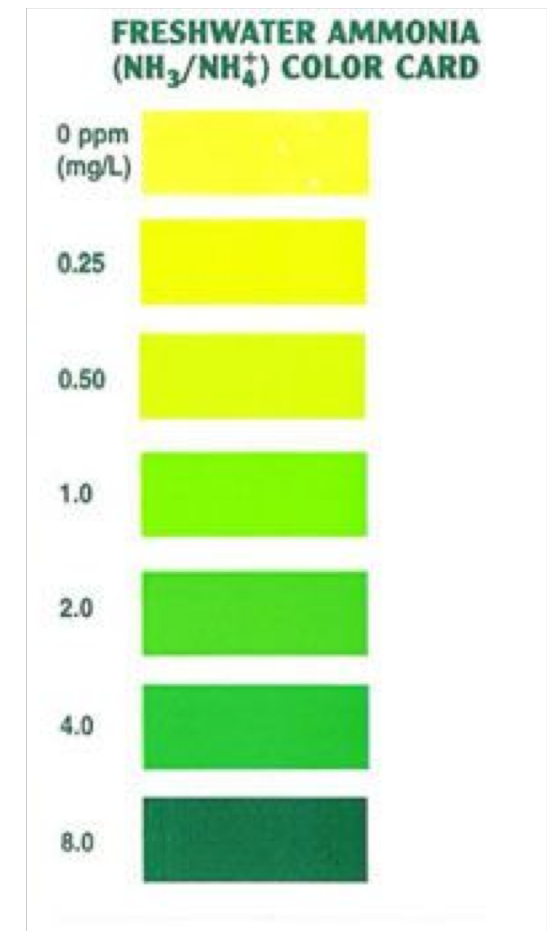

This is what the scientist found:

Tank 2 Results - Ammonia Test

The scientist uses an ammonia test kit to measure the ammonia in the first tank.

This is what the scientist found:

The Scientist's Experiment

To figure out where the ammonia was coming from, the scientist put different things from the aquariums into fresh water in separate jars. After a few hours, the scientist tested the water in the jars to see if it had ammonia. Here is what they found:

Fish Tank 1

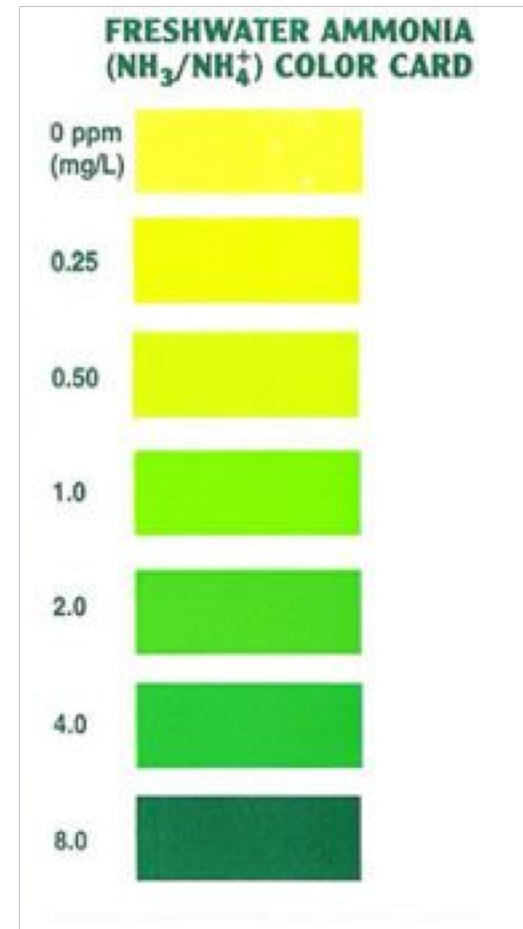

Fish Tank 2

Some gravel from the bottom of each of the tanks

Tank 1 looked like this:

Tank 2 looked like this:

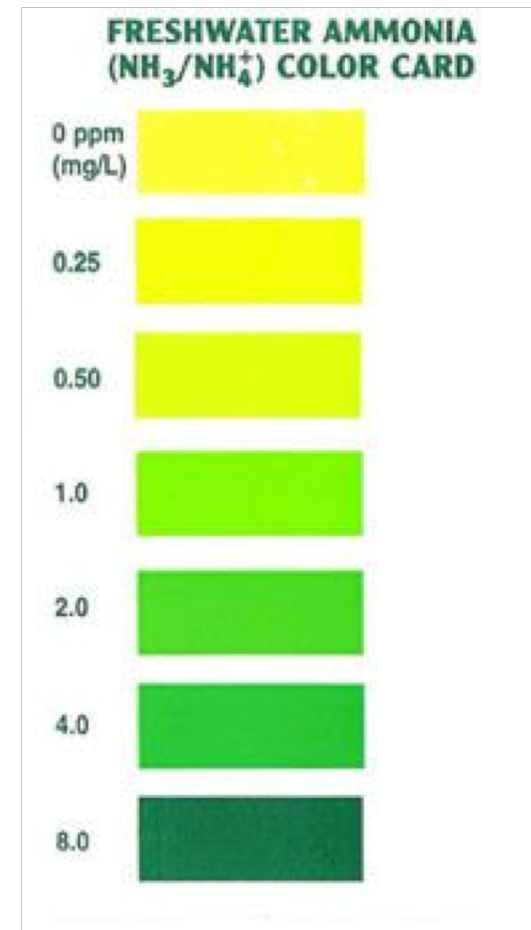

A plant from each of their tanks

Tank 1 looked like this:

Tank 2 looked like this:

A fish from each of their tanks

Tank 1 looked like this:

Tank 2 looked like this:
